

## MAC OS:

Go to the MySQL [website](#), scroll down the page and look for version Mac OS X ver. 10.6 (x86, 64-bit), DMG Archive. Select download and it will take you to a page that asks you to login or signup. You don't have to signup, instead there is a link right below these buttons. Click the link "No thanks, just start my download." This will start the download.

After downloaded you will need to install all 3 of the components in the package. Double-click on each package to install them. **mysql-5.6.10-osx10.6-x86\_64.pkg** – MySQL software **MySQL.prefPane** – Allows mysql to stop/start **MYSQLEnterpriseItem.pkg** – Allows mysql to start when booted *Also, note to remember temporary password, if you lose that you have to reset that again.*

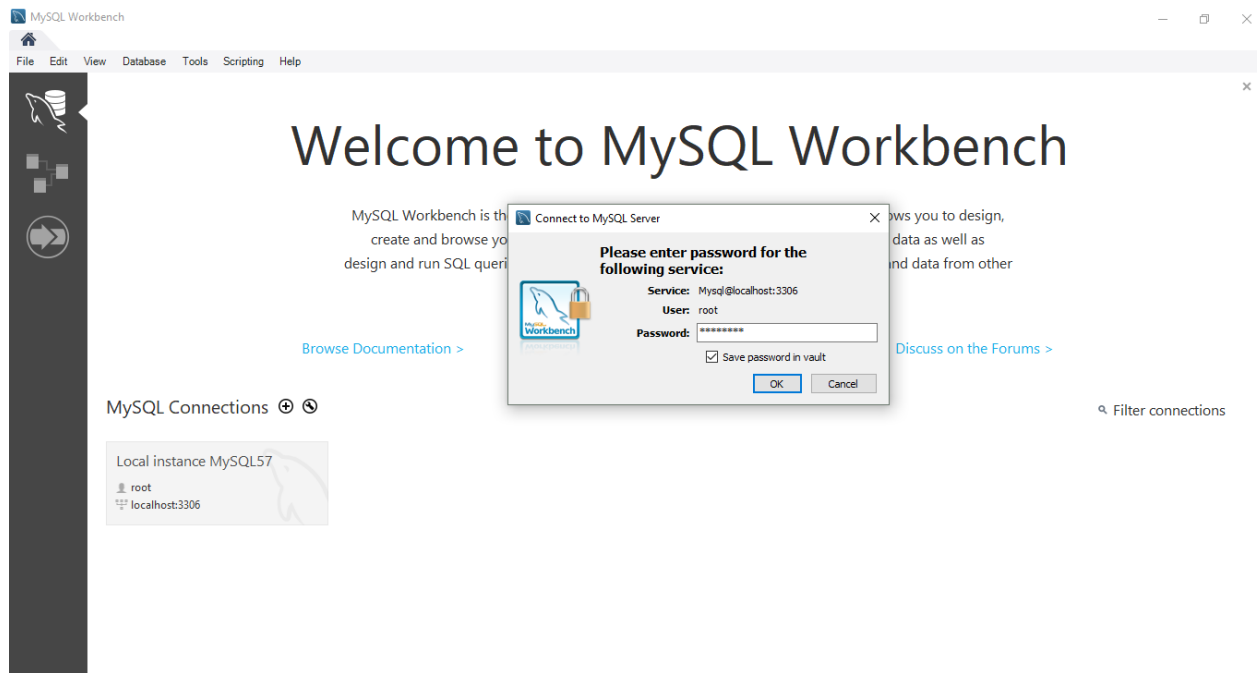

To start MySQL via the command line `sudo /usr/local/mysql/support-files/mysql.server start` Or you can click Start MySQL Server when the dialog opens after installing the 2nd package.

Set MySQL root password: `/usr/local/mysql/bin/mysqladmin -u root password 'yourpassword'` For more info, refer the [MySQL documentation](#).

For installing MySQL workbench:

<http://www.ccs.neu.edu/home/kathleen/classes/cs3200/MySQLWorkbenchMAC10.pdf>

MySQL workbench will open, and upon clicking MySQL connection you will be prompted for password, enter the root password here similarly to MySQL

Note: You may also install “DBeaver” instead of “MySQL workbench” for simpler user friendly GUI. The tool used throughout the session is MySQLWorkbench.

If you’ve forgotten your temp. password refer here or getting error access denied for user 'root'@'localhost'
